HELD TOGETHER

An interactive sculpture

Held by one support

A span, waiting to happen.

One cable holds the beam at rest.
Engage the second to lift the span.

Steel, clay, and the space between.

How it is held

HELD TOGETHER

An interactive sculpture

Held by two supports

The weight moves. The work is shared.

Move the clay weight along the beam.
Each cable carries a different share.

Weight position along beam 2.25 m

A B

HELD TOGETHER

An interactive sculpture

Force drawing

How the weight is shared.

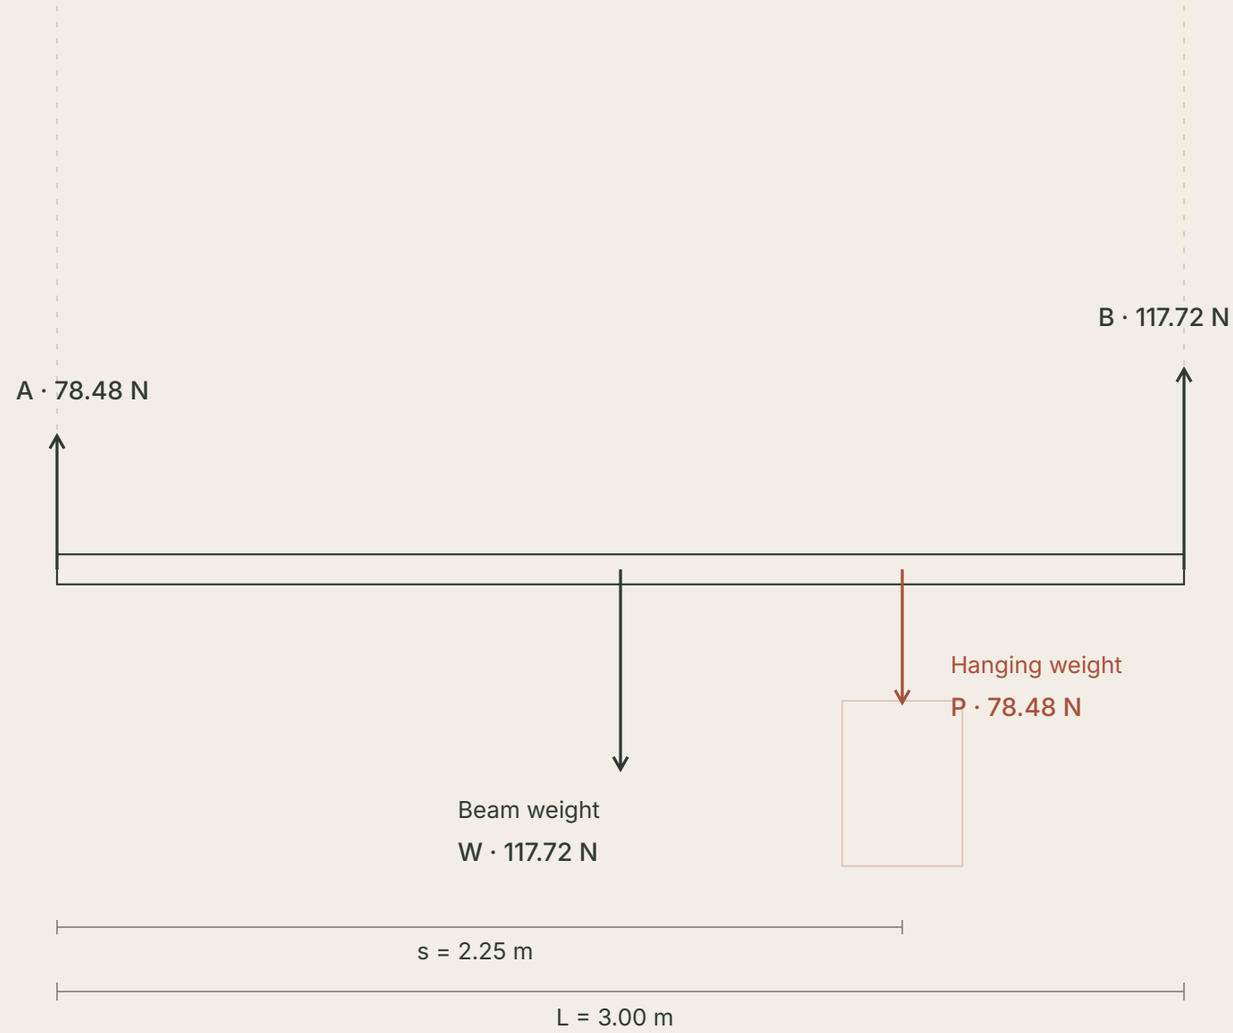

The same beam, with its forces made visible.

$A + B = W + P = 196.20\ \text{N}$

$B \cdot L = W \cdot L/2 + P \cdot s$

Uniform beam 12 kg · hanging weight 8 kg
g = 9.81 m/s² · beam self-weight included

Virtual parameters. Static equilibrium only.

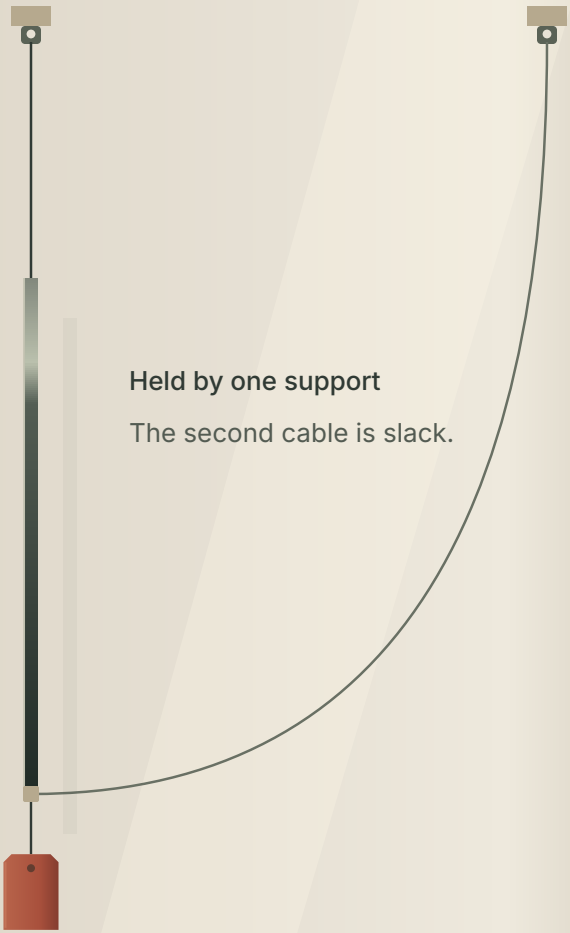

Upward support balances downward weight.

Arrow lengths share one force scale.
